# 2022 Consumer Confidence Report

Water System Name:

Valley Home School - Pioneer

Report Date:

02/26/23

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 - December 31, 2022 and may include earlier monitoring data.

### Este informe contiene información muy importante sobre su agua para beber. Favor de comunicarse Valley Home School - Pioneer a (209) 838-7842 para asistirlo en español.

Type of water source(s) in use:	Groun	Groundwater Well					
Name & general location of source	Main) Well at 13231 Pioneer Ave. Valley Home, CA						
Drinking Water Source Assessme	nt inform	ation:	Completed in June of 20	02 - se	e next	page	
Time and place of regularly sched	luled boa	rd meetings	s for public participation:		None	3	
For more information, contact:	Quality	Quality Service, Inc.		Pho	one:	(209) 838-7842	
		TERM	MS USED IN THIS REPO	ORT		-1	

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected PHGs are set by the California risk to health. Environmental Protection Agency.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Primary Drinking Water Standards (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Variances and Exemptions: State Board permission to exceed an MCL or not comply with a treatment technique under certain conditions.

ND: not detectable at testing limit

**ppm**: parts per million or milligrams per liter (mg/L)

**ppb**: parts per billion or micrograms per liter (μg/L)

ppt: parts per trillion or nanograms per liter (ng/L)

ppq: parts per quadrillion or picogram per liter (pg/L)

pCi/L: picocuries per liter (a measure of radiation)

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

### Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

SWS CCR Form Revised January 2023 In order to ensure that tap water is safe to drink, the U.S. EPA and the State Board prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The U.S. Food and Drug Administration regulations and Callifornia law also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, and 5 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old.

\*Any violation of an MCL, MRDL, AL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

TABLE 1	- SAMPLIN	G RESULT	S SHOWIN	G THE DE	FECTIO	N OF COL	LIFORM BACTERIA	
Contaminants	Highest No. of Detections	No. of	Months olation	MCL		MCLG	Typical Source of Bacteria	
E. Coli	0		0	(a)		0	Human and animal fecal waste	
2. con positive routile sain	pie or system	tans to ana	iyze totai col	iform-positiv	e repeat :	sample for	ils to take repeat samples following E. coli.	
Lead and Copper (and reporting units)	Sample Date	No. of Samples	90th Percentile Level	No. Sites Exceeding	AL	PHG	EAD AND COPPER  Typical Source of Contaminant	
Lond (aut.)		Collected	Detected	AL				
Lead (ppb)	10/03/22	5	< 5	0	15	0.2	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits	
Copper (ppm)	10/03/22	5	0.3	0	1.3	0.3	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives	
	TABLE 3	-SAMPL	ING RESUI	LTS FOR SO	DIUM .	AND HAR	DNESS	
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Rai	Range of Detections		PHG (MCLG)	Typical Source of Contaminant	
Sodium (ppm)	08/03/20	24			None	None	Salt present in the water and is generally naturally occurring	
Hardness (ppm)	08/03/20	170			None	None	Sum of polyvalent cations present in the water, generally magnesium and calcium, and are usually naturally occurring	

# **Vulnerability Assessment Summary**

A source water assessment was conducted for the South Well of the Valley Home School Pioneer water system in June of 2002. The source is considered most vulnerable to the following activities not associated with any detected contaminants: historic gas stations and septic systems - high density. Nitrates have been detected above half of the State established maximum contaminant level (MCL). Additional monitoring for this contaminant is required per State standards.

The following activities are associated with nitrates: injection/dry wells/sumps, septic systems - high density, and animal operations. Barium has been detected below half of the MCL. The following activities are associated with barium: discharge of oil drilling wastes from metal refineries and erosion of natural deposits. For more information regarding the assessment summary, contact Quality Service, Inc. at: (209) 838-7842.

TABLE 4 – DETECTION OF CONTAMINANTS WITH A <u>PRIMARY</u> DRINKING WATER STANDARD								
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL [MRDL]	PHG (MCLG) [MRDLG]	Typical Source of Contaminant		
Nitrate as Nitrogen (ppm)	10/03/22	6		10	10	Runoff and leaching from fertilizer use; leaching from septic tanks and sewage; erosion of natural deposits		
Fluoride (ppm)	08/03/20	0.2		2	1	Erosion of natural deposits; water additive which promotes strong teeth; discharge from fertilizer and aluminum factories		
Barium (ppm)	08/03/20	0.2		1	2	Discharge of oil drilling wastes and from metal refineries; erosion of natural deposits		
TABLE 5 – DETI	TABLE 5 – DETECTION OF CONTAMINANTS WITH A <u>SECONDARY</u> DRINKING WATER STANDARD							
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	SMCL	PHG (MCLG)	Typical Source of Contaminant		
Total Dissolved Solids (ppm)	08/03/20	310		1000	N/A	Runoff/leaching from natural deposits		
Specific Conductance (umho/cm)	08/03/20	430		1600	N/A	Substances that form ions when in water; seawater influence		
Chloride (ppm)	08/03/20	8		500	N/A	Runoff/leaching from natural deposits; seawater influence		
Zinc (ppm)	08/03/20	0.1		5	N/A	Runoff/leaching from natural deposits		
Sulfate (ppm)	08/03/20	13		500	N/A	Runoff/leaching from natural deposits' industrial wastes		
Turbidity (NTU)	08/03/20	0.2		5	N/A	Soil runoff		

<sup>\*</sup>Any violation of an MCL, MRDL, AL, or TT is asterisked. Additional information regarding the violation is provided below.

## Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Pioneer School is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at: http://www.epa.gov/lead.

Nitrate as Nitrogen in drinking water at levels above 10 mg/L is a health risk for infants of less than six months of age. Such nitrate levels in drinking water can interfere with the capacity of the infant's blood to carry oxygen, resulting in serious illness; symptoms include shortness of breath and blueness of the skin. Nitrate-N levels above 10 mg/L may also affect the ability of the blood to carry oxygen in other individuals, such as pregnant women and those with specific enzyme deficiencies. If you are caring for an infant, or you are pregnant, you should ask advice from your health care provider.
